

Interfacing Client's Accounting System with HIMS

Client

St. Raphael Private Hospital is the first and only private hospital in Larnaca, Cyprus, and is leading the way in medical expertise, cutting-edge technology, innovation, environment and the little extras that make all the difference.

Need

Transferring the financial data from the HIMS to the external accounting system was paper-based that was time consuming and expensive. Hence the hospital needed to interface the accounting software (CYCOM) with Cintiti health HIMS to automate the transfer of day-to-day financial transactions of the hospital.

Challenge

Maintenance of accounts has long been a hard and tedious task for the St Raphael Private hospital.

The complexities involved in the book keeping process caused delays and errors, which in turn affected the operational efficiency of the accounts department.

Solution – Cintiti health Barcode Technology

EVANGELSOFT provided a solution in Cintiti health accounts management, with which the user could interface the local accounting software (CYCOM) with Cintiti Health.

Cintiti health has been successfully designed and implemented for mapping the financial data for daily, weekly and monthly transactions of the hospital. Cintiti health gives an excellent analysis of financial data of the hospital, which can be transferred easily to the accounts system. This allows the user to generate the reports for hospital income summary, doctors' income summary, list of credit notes etc.

The accounts interface module of Cintiti health is designed to accommodate any external accounting systems with minimal customization.

Benefits

- Cintiti health provided the hospital with up-to-date financial information that was required for the external accounting software CYCOM.
- Formerly, the data was manually entered into the accounting software, which was cumbersome and often prone to human error. At the click of button the hospital was able to directly import the financial reports to the external accounting software CYCOM.
- The accounts management module has given the flexibility required not only to perform basic financial resource management tasks, but also to make their entire finance and accounting department operate more efficiently.
- The system saves the hospital from printing hundreds of reports weekly/monthly and the operation is performed in seconds rather than hours/days.
- All of the customers and financial information of the hospital is stored in one place so that the hospital can have a complete view of their business.
- Having the relevant data available electronically makes it easier for the hospital to find the necessary file immediately instead of searching for paper.
